DIGITAL TRANSITION AT INDUSTRIES

Seeing the present and projecting the future.

Filipe Portela

University of Minho (Invited Assistant Professor)
IOTECH(Founder & CEO)

AGENDA

1. INDUSTRY

- a. Digital Transition
- b. Problems
- c. Industry 5.0
- d. Trends

2. PROJECTS

- a. be@t
- b. GIATex
- c. LCA
- d. All-in-One Solution

Que palavras associa à transição digital?

INDUSTRY

DIGITAL TRANSITION

- ✓ The transition to a digital landscape is profoundly impacting industries, leading to **automation**, new **business models**, and enhanced **operational efficiency**.
- ✓ This digital transformation, often referred to as **Industry 4.0**, is characterized by the **integration** of **technologies** like **AI**, Internet of Things (**IoT**), and **cloud computing** into manufacturing processes.
- ✓ It enables **smart factories**, data-driven decision making, and personalized customer experiences, offering significant competitive advantages.
- ✓ Beyond the **impact**, managers are often left with many **questions** and **uncertainties**:
 - Is the digital transition truly **relevant** to my **industry**?
 - What **really matters** most in this process?
 - Where should I **begin**?
 - Will **digitalisation** actually solve my problems?
 - How difficult is it to create a **smart factory** and monitor all my **consumption**?
 - What are the **key challenges** facing industry today, and how can digital technologies help address them?

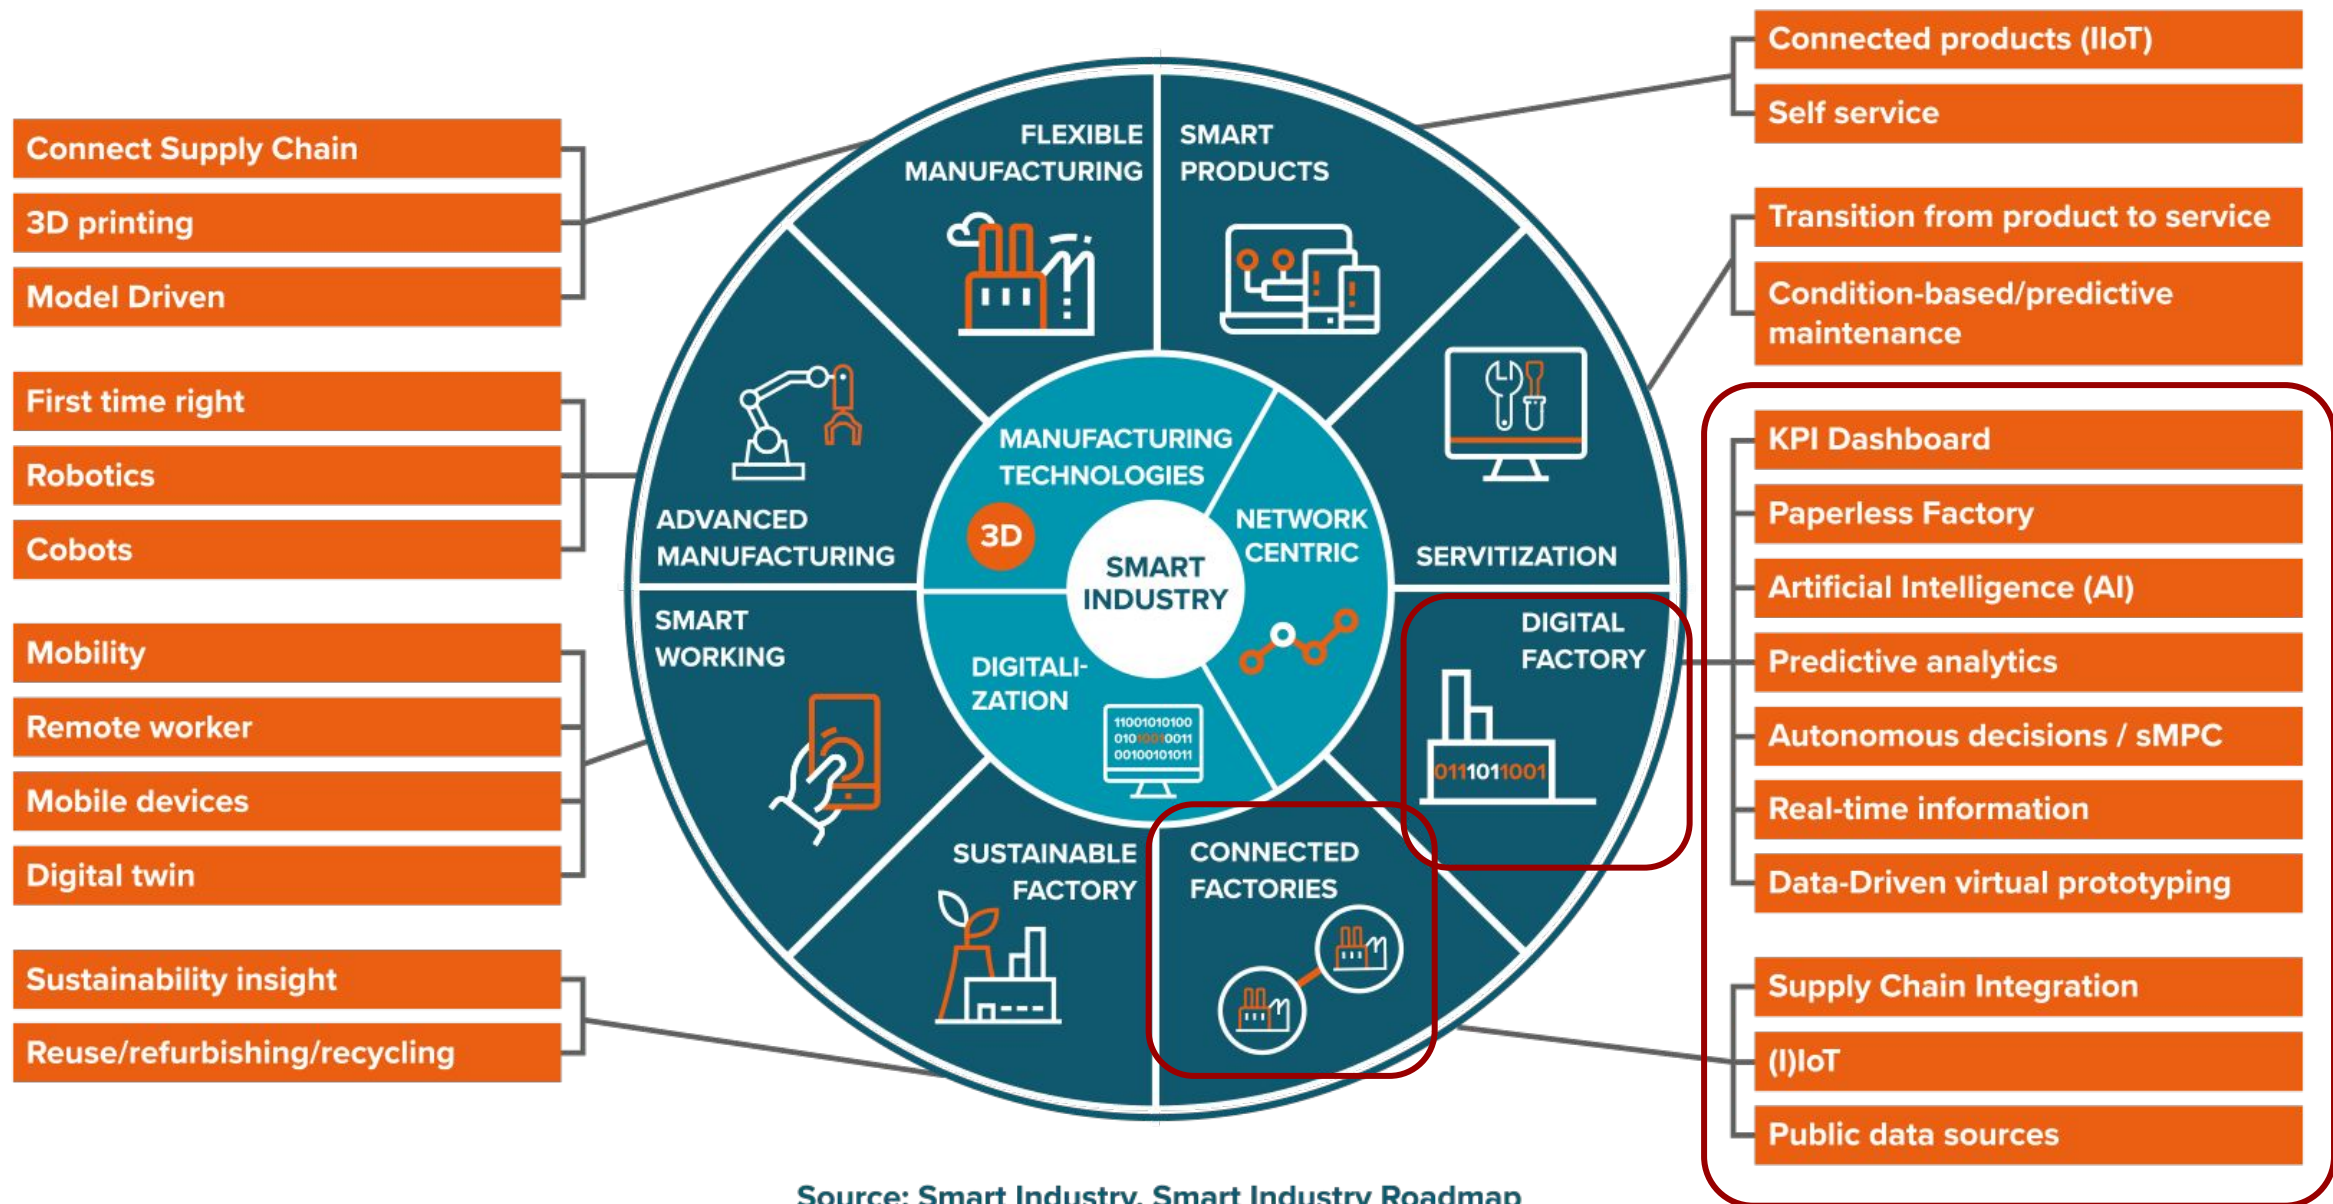

INDUSTRY

DIGITAL TRANSITION

✓ Key Aspects of Digital Transformation in Industries:

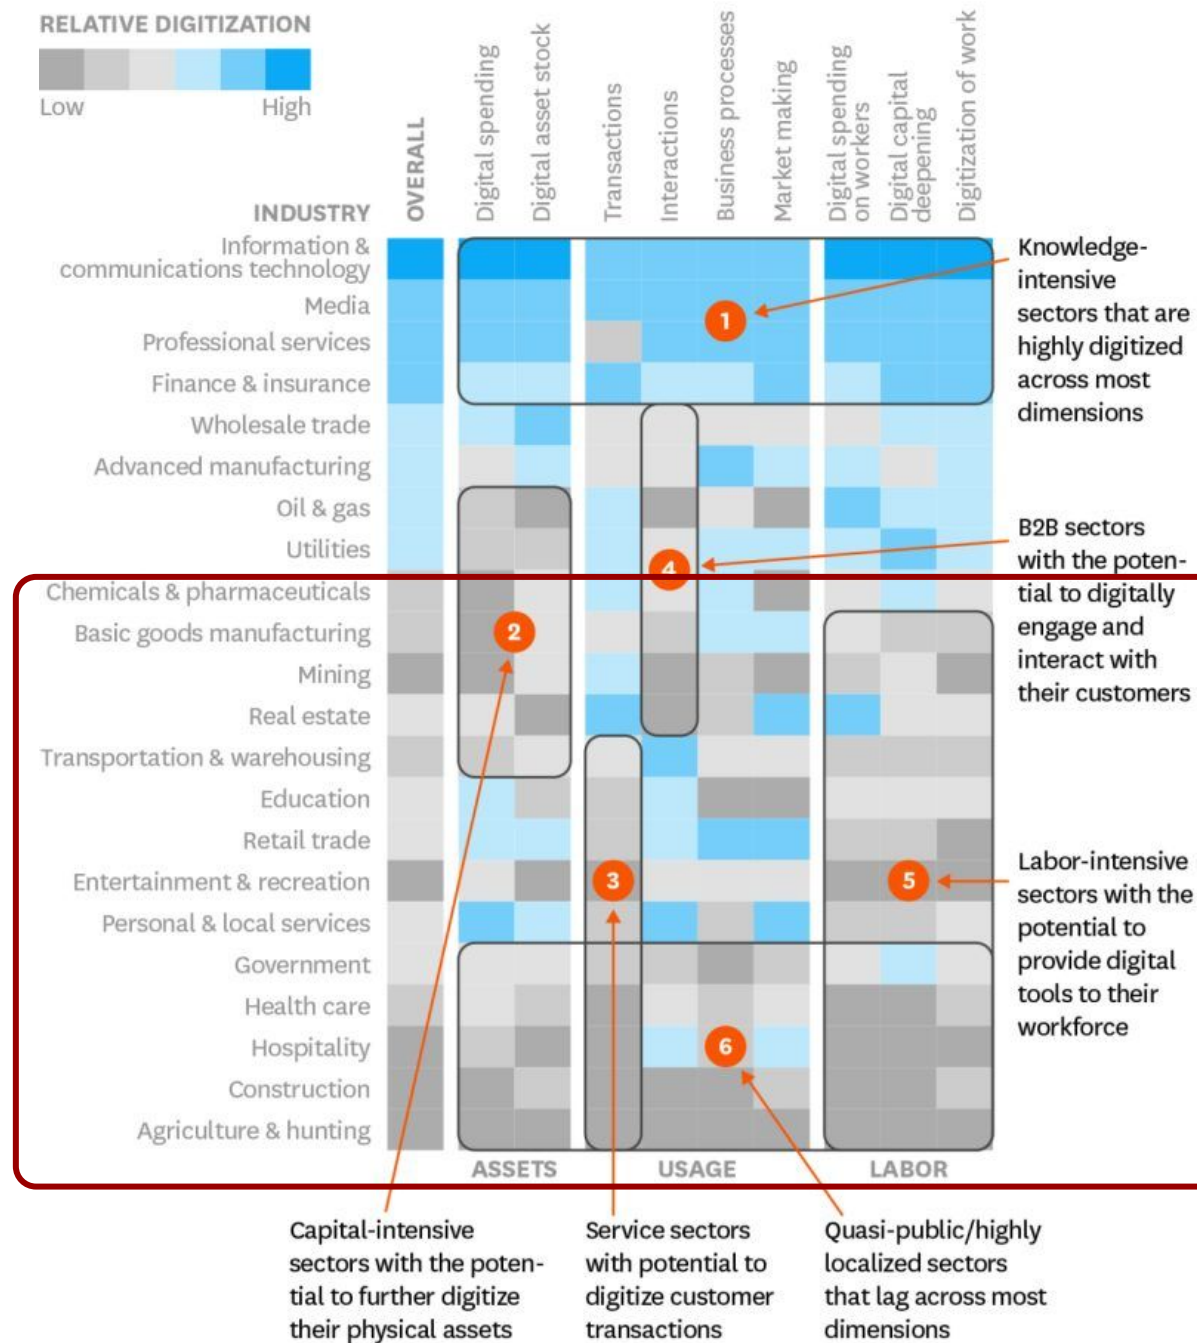

1. **Automation and Efficiency:** Digital technologies automate tasks, optimize resource utilization, and streamline production processes, leading to increased efficiency and reduced costs.
2. **Data-Driven Insights:** The ability to collect and analyze vast amounts of data from production processes allows companies to gain valuable insights into market trends, customer behavior, and operational performance, enabling informed decision-making.
3. **New Business Models:** Digitalization allows companies to explore new revenue streams and business models by developing innovative products and services, offering personalized experiences, and creating connected ecosystems.
4. **Enhanced Collaboration:** Digital platforms and tools facilitate better communication and collaboration among teams, both within and outside the organization, fostering innovation and agility.
5. **Resilience and Sustainability:** Digital transformation can improve a company's resilience to market fluctuations and disruptions, while also enabling more sustainable practices through optimized resource management and reduced waste.

INDUSTRY

- ✓ Industry produces many **wastes**, and industrial **symbiosis** is not efficient
- ✓ **Water consumption** in Industry is huge
- ✓ **Energy** with high **consumption** and costs and high rates of greenhouse **gas emissions**;
- ✓ **Data** are **inconsistently** and **manually recorded**
- ✓ **Processes** are **not optimized**, and data are not used to predict failures
- ✓ Product **LCA** is **challenging** to track and calculate
- ✓ Difficulties in having an **aggregated** view of **consumption**, noticing excess consumption or leakages and crossing invoices with actual expenses;
- ✓ Difficulties in meeting **European targets** to reduce annual energy consumption by 32.50% by 2030.

INDUSTRY

DIGITAL TRANSITION

Are we ready to Industry 5.0?

- ✓ Despite **living in an era of advanced digitalisation**, many companies remain stuck in an **outdated industrial paradigm**.
- ✓ Systems like **CRM or ERP**, once seen as milestones of digital transition, should by now be considered basic infrastructure. However, the reality is that many organisations still operate at an **Industry 2.0/3.0 level**, relying heavily on **paper-based and manually processes, information silos, lack of interoperability**, and using **digital tools merely to replicate manual processes** rather than to transform them.
- ✓ This gap highlights the **urgent need** for a true **digital transformation—one** that integrates systems, enables real-time data flows, and supports smart, sustainable, and human-centric operations aligned with **Industry 5.0** principles.

INDUSTRY

DIGITAL TRANSITION

CRM

- Customer Data
- Marketing Management
- Sales Management
- Quoting
- Sales Configurator

MES

- Manufacturing Execution
- Part Consumption
- Work Order Management
- KPI Tracking for Cycle Time
- Operator Training Qualified

- Order
- ECO
- Items
- xBOM's
- Inventory
- Alternates
- BOM Effectivity
- Routing
- Costing
- Supplier Items

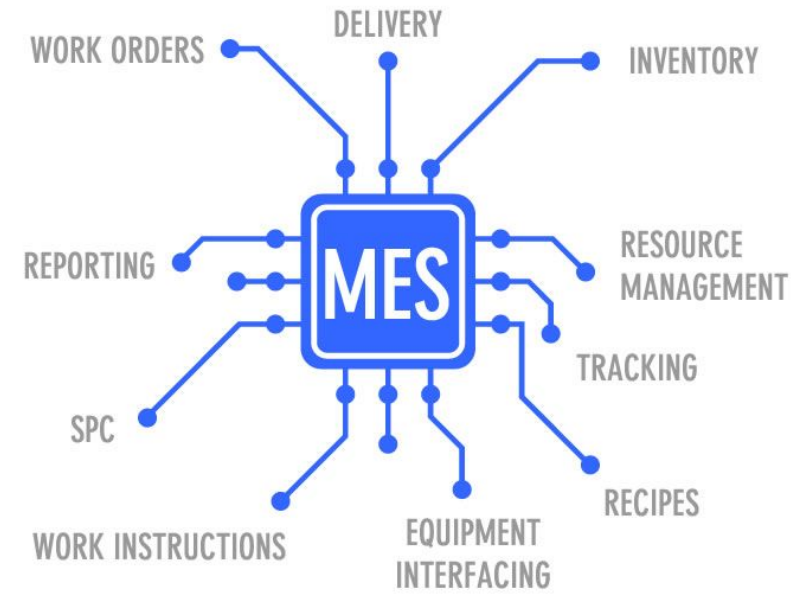

ERP

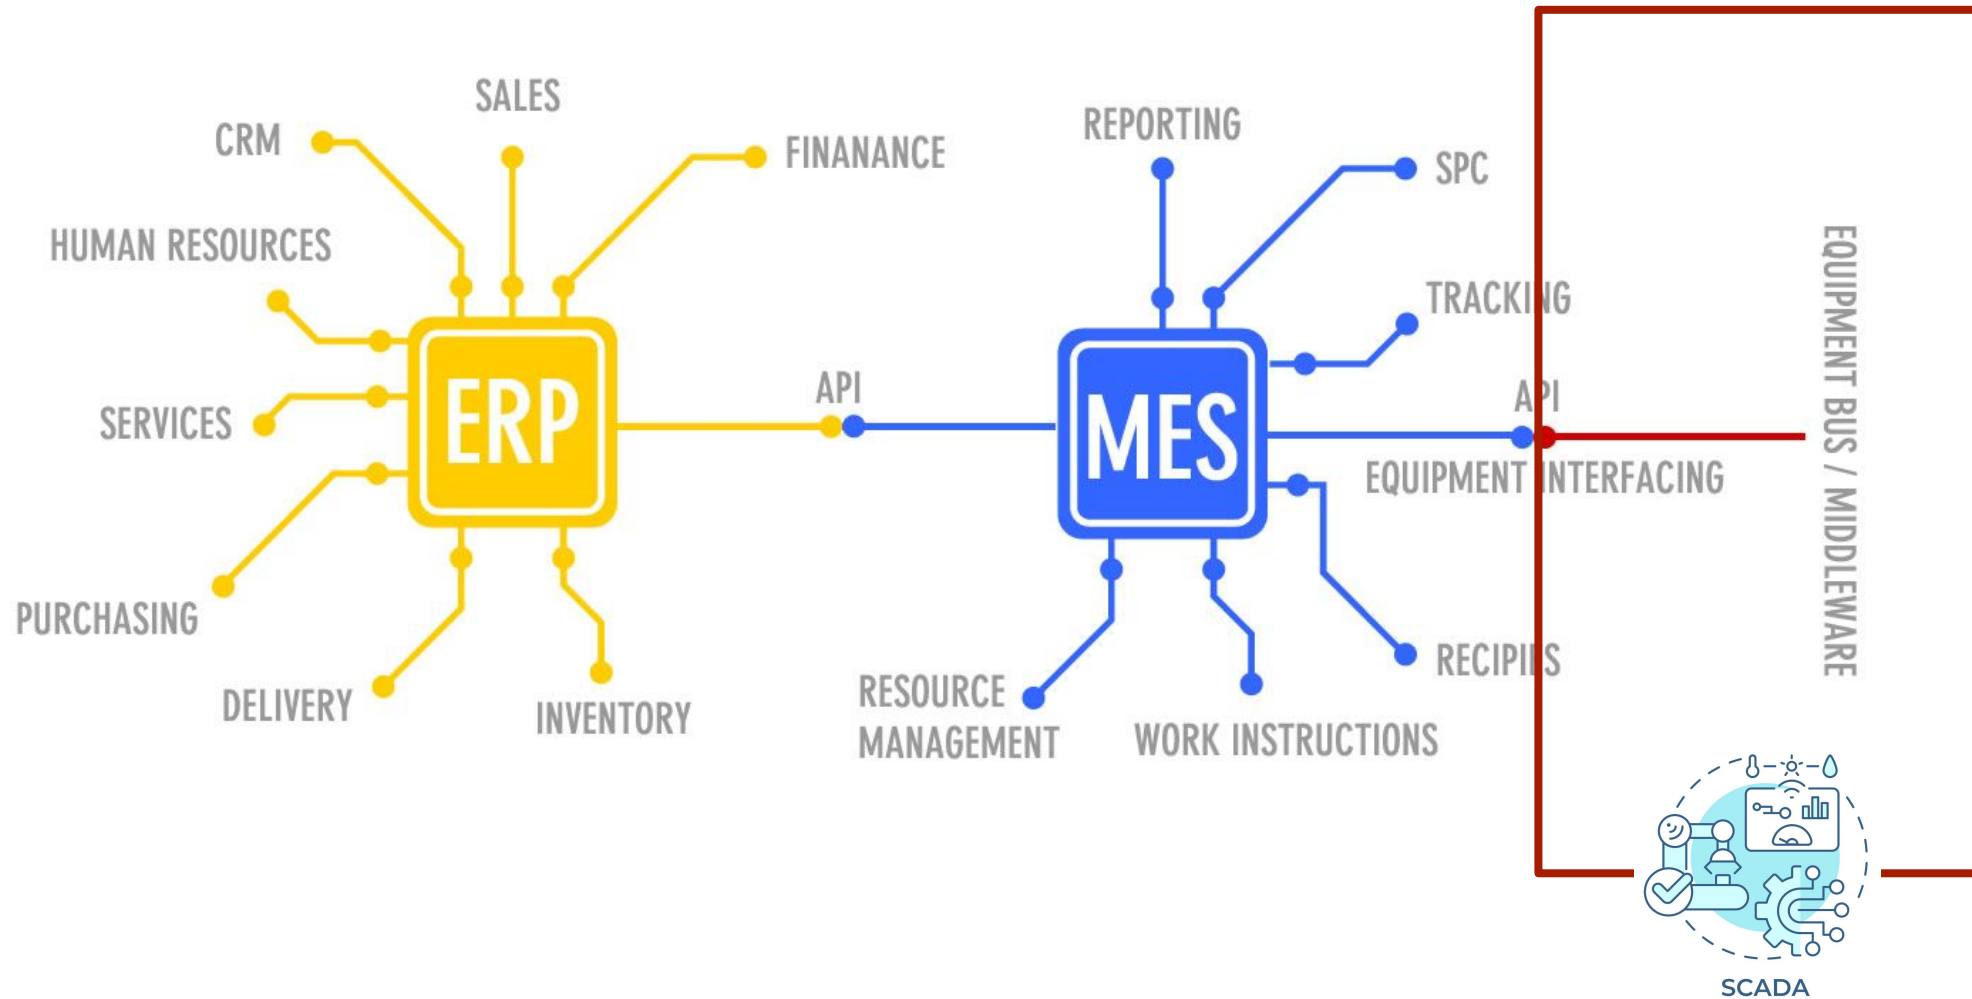

- Inventory Management
- Plant Maintenance
- Purchasing

- Document Management
- Project Management
- Change Management
- Workflows
- Product Configurations
- Systems Engineering
- Technical Publications

INDUSTRY - ERP vs MES

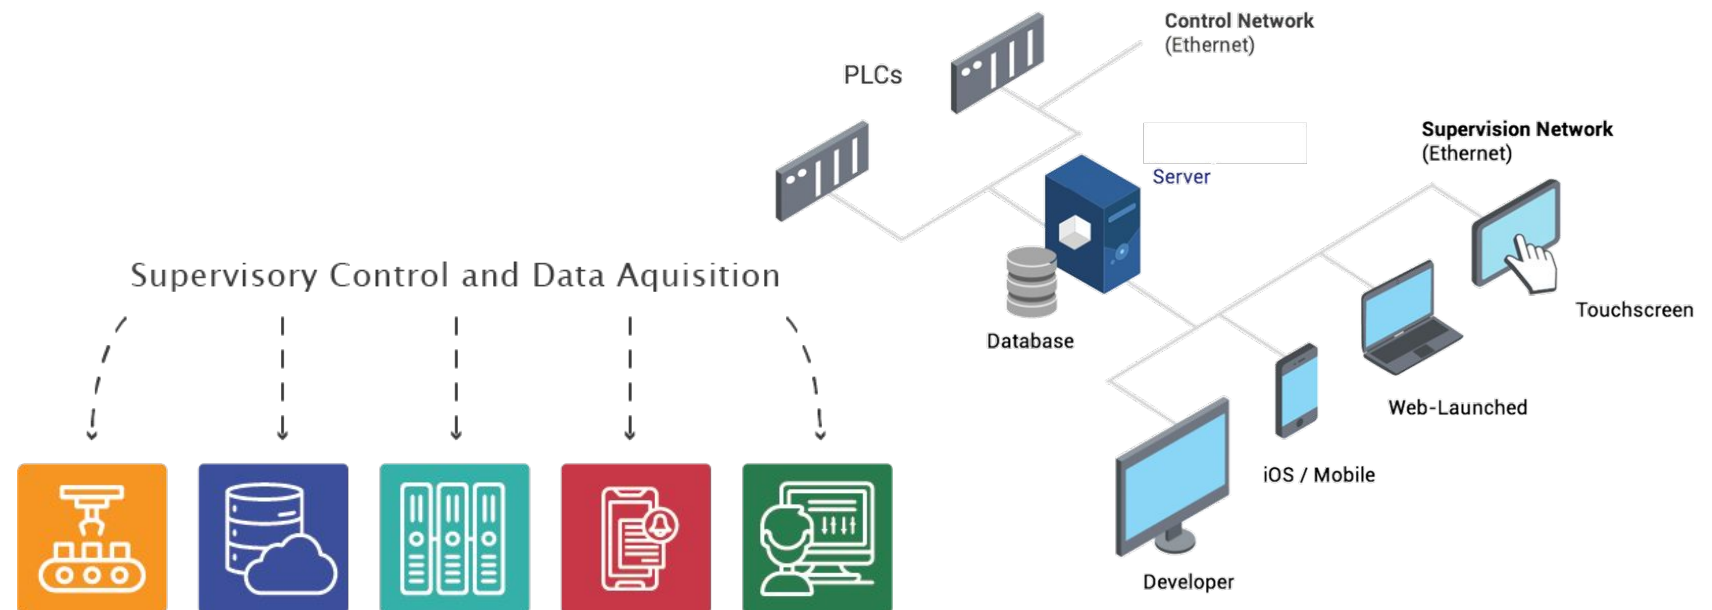

INDUSTRY

SCADA

SCADA stands for Supervisory Control And Data Acquisition.

- ✓ It refers to systems used to **monitor, control, collect data**, and **send alerts** from industrial and infrastructure processes.
- ✓ SCADA helps keep complex operations running safely and efficiently by providing **real-time supervision** and **control**.
- ✓ It is essential to ensure proper **interoperability** between **MES** and **ERP** systems. Without this connection, all data must be entered manually, increasing the risk of errors and reducing the system's fault tolerance.

INDUSTRY

NOW

INDUSTRY

FUTURE

INDUSTRY

5.0

TRENDS

- ✓ **Smart Factories** integrates IoT, AI, and automated actuators for enhanced operation and management. This system enables real-time monitoring, process optimization, and predictive maintenance. Actuators play a crucial role, actively adjusting mechanisms in response to data insights, promoting energy efficiency, reducing waste, and boosting productivity for sustainable, streamlined manufacturing processes.
- ✓ **Energy Sustainability** emphasizes using sensors for monitoring and actively reducing energy consumption. This approach involves continuously analyzing energy usage patterns to identify and implement efficiency improvements. Optimizing energy use contributes to environmental sustainability and supports the shift towards renewable energy sources.
- ✓ **Industrial Symbiosis** is an approach where different industries collaborate to optimize resource utilization by exchanging materials, Energy, or waste. This practice creates a network where waste from one industry becomes raw material for another, reducing environmental impact and improving sustainability, efficiency, and cost-effectiveness in industrial processes.

INDUSTRY

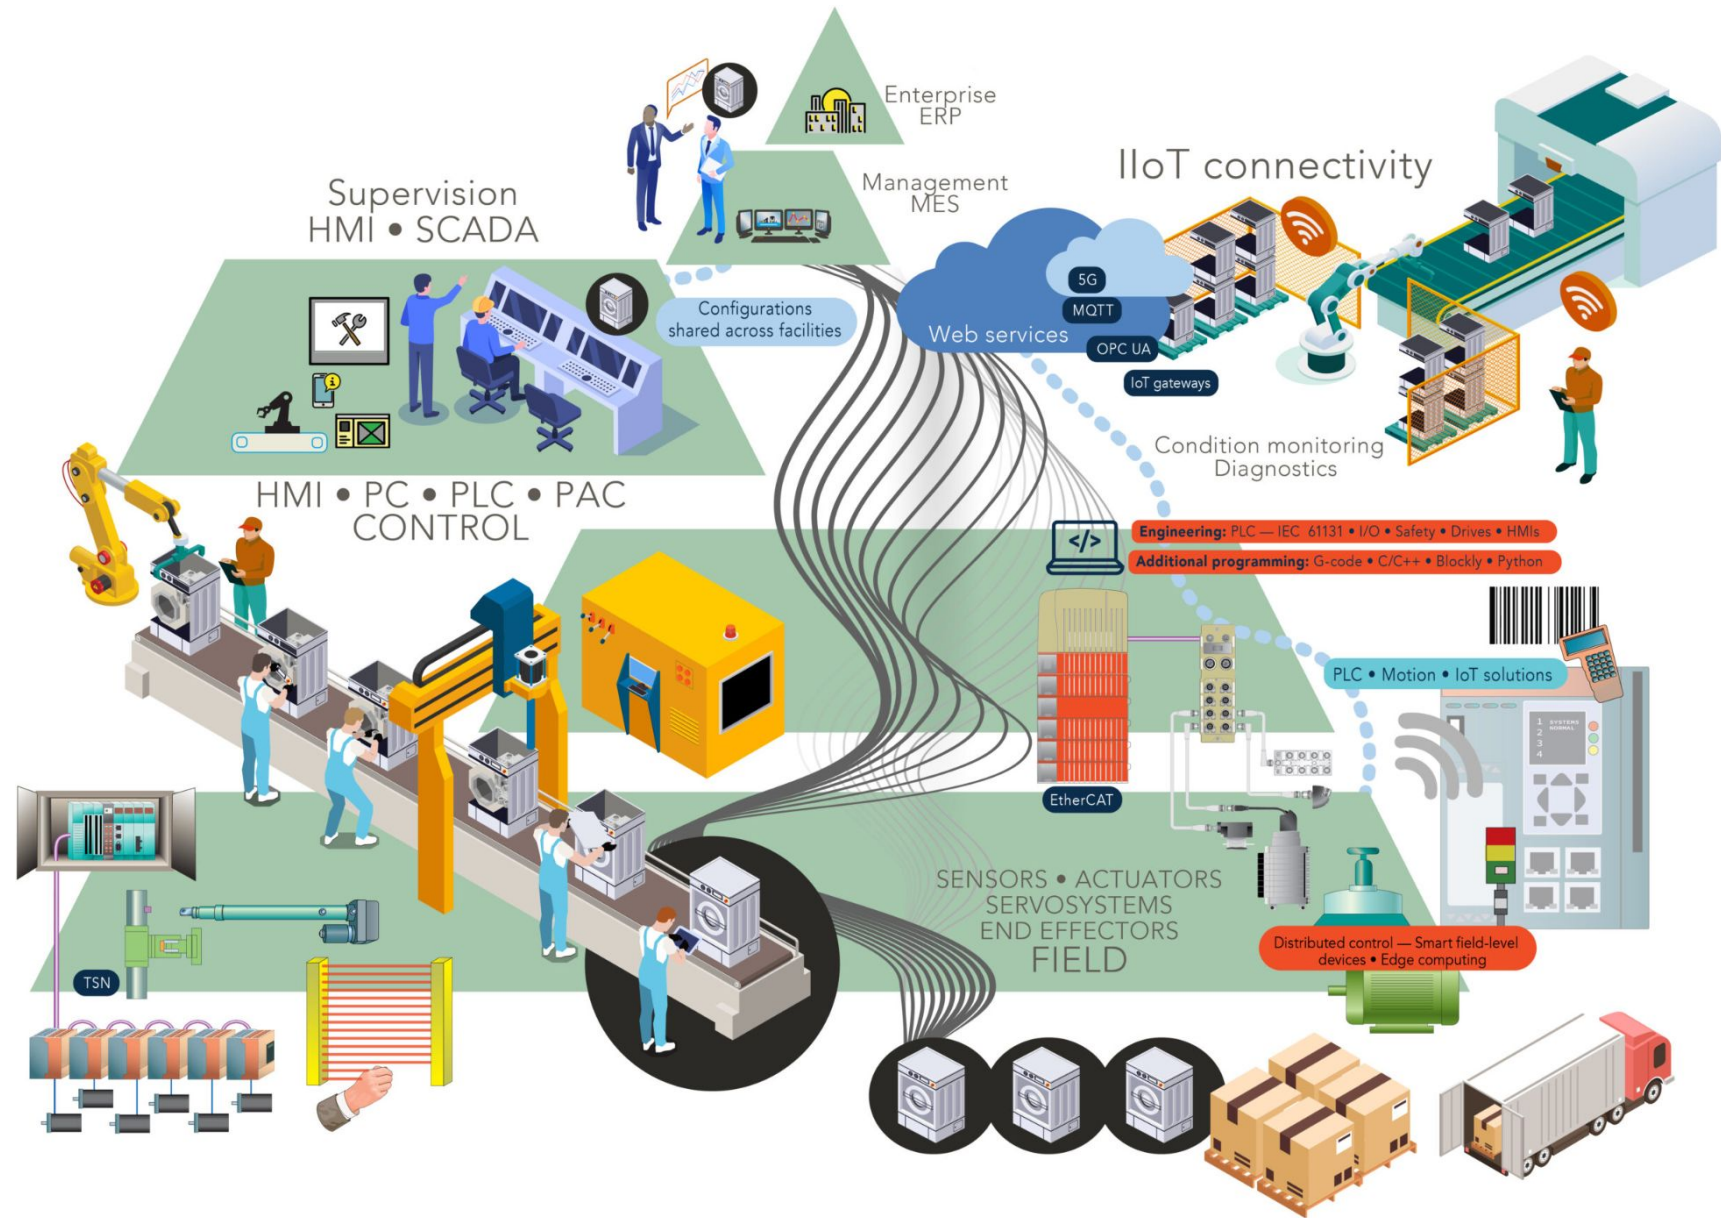

5.0

TRENDS

- ✓ **Smart LCA** (Life Cycle Assessment) is a systematic approach for evaluating the environmental impacts of a product or process throughout its lifecycle. It incorporates intelligent data collection and analysis technologies, aiming to optimize sustainability by assessing resource use, emissions, and waste from production to disposal.
- ✓ **Smart Water Management** uses advanced technologies like sensors, data analytics, and automation to manage water resources efficiently. It aims to optimize water usage, reduce wastage, improve water quality, and ensure sustainable water supply, particularly in urban areas, through intelligent monitoring and management systems.
- ✓ **Predictive Maintenance** employs sensors and machine learning to foresee equipment failures and detect defects early. This method facilitates timely repairs, minimizing downtime and costs while extending equipment life. Essential in various industries, it enhances operational efficiency and reliability by preemptively addressing potential issues and defects.

INDUSTRIAL SYMBIOSIS

BE@T

Be@t - Bioeconomy at textiles, aims to promote and value the **bioeconomy** for the **Textile** and **Clothing** sector, to accelerate the production of high-value-added products from biological resources as an alternative to fossil-based materials, namely:

- ✓ Develop **new products** and textile materials of biological origin, renewable and with better environmental labels;
- ✓ Explore innovative **eco-design** and **eco-engineering** approaches to ensure the circularity of textile products;
- ✓ Promote **reuse, collection** and **recycling** of textiles, as well as effective regional policies to implement circular value chains;
- ✓ Contribute to a **culture** of **sustainability** and responsible **consumption**.

INDUSTRIAL SYMBIOSIS

BE@T

INDUSTRIAL SYMBIOSIS

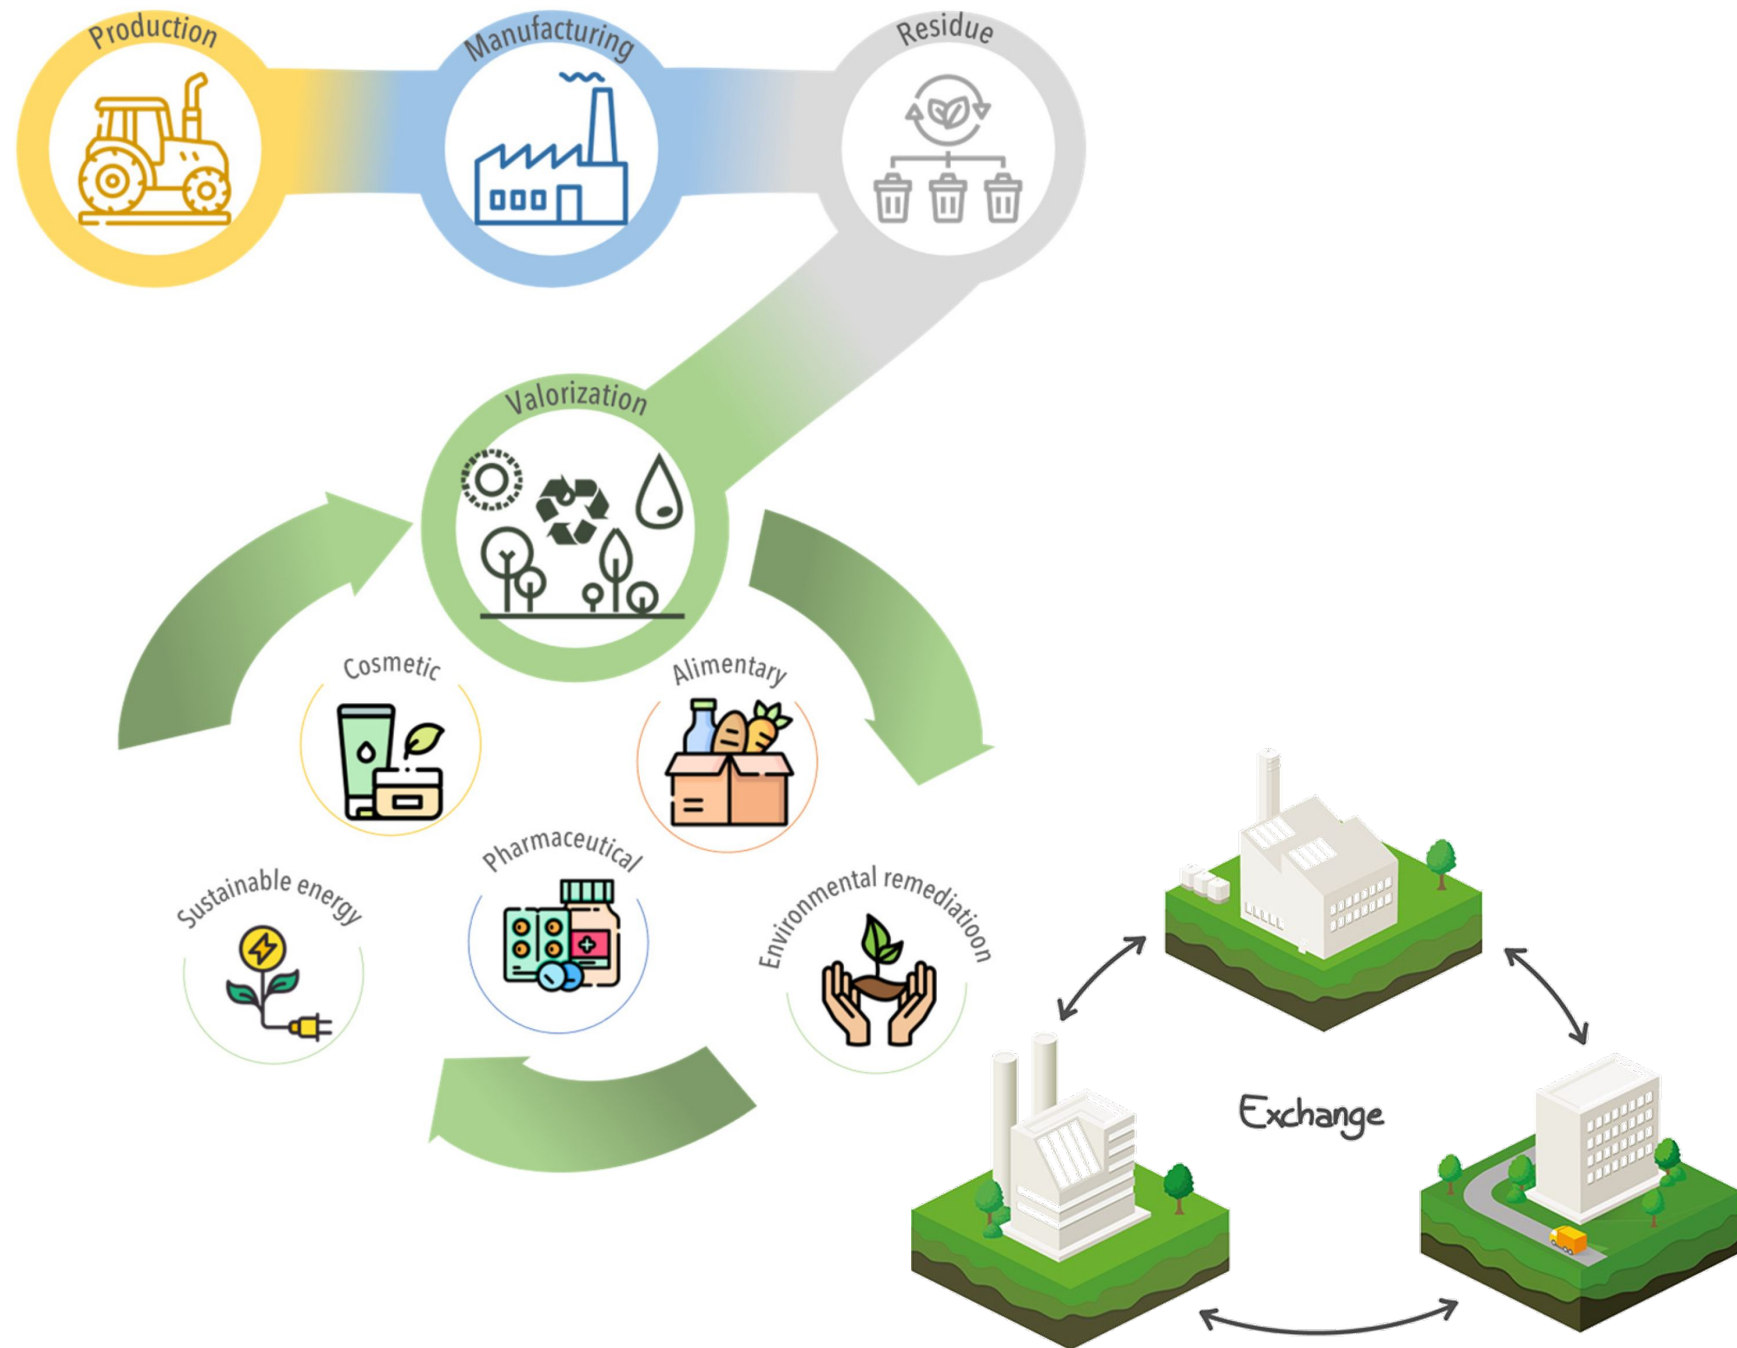

BE@T

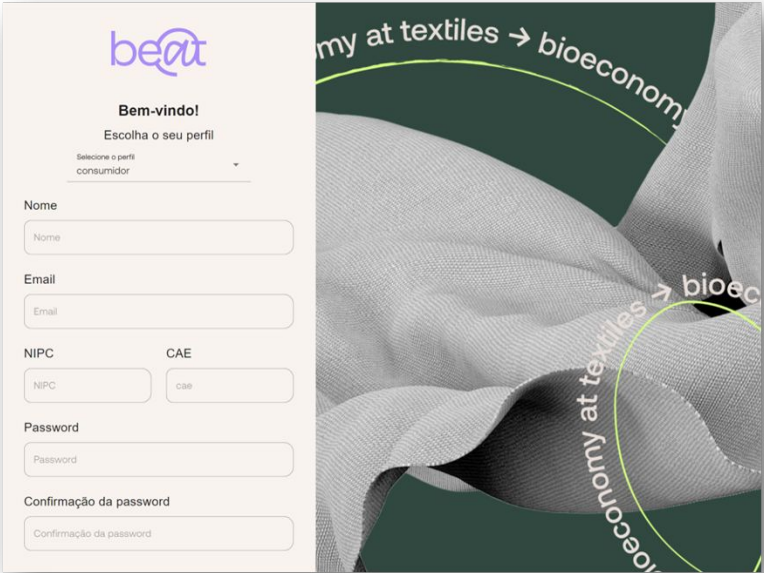

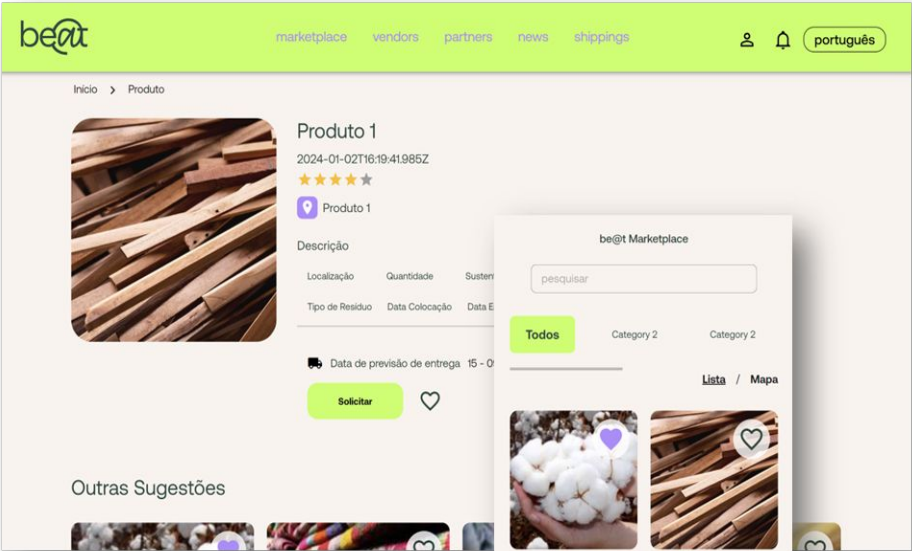

Team is developing an IT platform to foster **industrial symbiosis**, featuring:

- ✓ **Intermediation** between companies
- ✓ Intuitive **Marketplace**
- ✓ Web / Mobile **App**
- ✓ **Intelligent** match **algorithm**
- ✓ Short **Supply Chains**
- ✓ Visualization of **environment** and **economical** impacts
- ✓ Info about **legal requirements**
- ✓ Suggest the best end to a **Waste** according to **Sustainability** rules
- ✓ 3 Types of **users**: consumers, producers and transportation companies
- ✓ **APA registration** for platform access verification

INDUSTRIAL SYMBIOSIS

BE@T

SMART WATER MANAGEMENT

GIATEX

The GIATEX project aims to respond to the **challenges** faced by textile manufacturing companies in terms of intensive **water consumption**.

Solution consists in developing **tools** and **technologies** that **allow** for a **reduction** in the specific **water** consumption in **textile** finishing companies through the adoption of **less water-intensive technologies** and the implementation of **intelligent monitoring** and process control systems.

The aim is to develop a set of tools that will enable companies to:

1. **Reduce** specific **water** consumption (use of less intensive finishing technologies and adoption of treatment technologies that allow water to be reused)
2. **Support decisions** on the final destination of water (through the integration of process monitoring and **control systems** and a new water management support tool).

This contributes to **environmental sustainability** and more efficient **management** of **water** resources in the sector.

SMART WATER MANAGEMENT

GIATEX

SMART WATER MANAGEMENT

GIATEX

IT decision support tool for **water management**, featuring:

- ✓ **Monitor water consumers** in each process, section or machine of enterprises
- ✓ **Configuration** of **water** parameters to be monitored
- ✓ Takes into account the organisation's **business rules**
- ✓ **Mapping sensors** to machines/sections
- ✓ **Analytical dashboards**
- ✓ **Real-time** alert **systems**
- ✓ **Interconnection** with **company systems**

SMART LCA

GLOBAL PLATFORM

A **Life Cycle Assessment (LCA)** is defined as the systematic **analysis** of the potential environmental **impacts** of **products** during their entire **life cycles**.

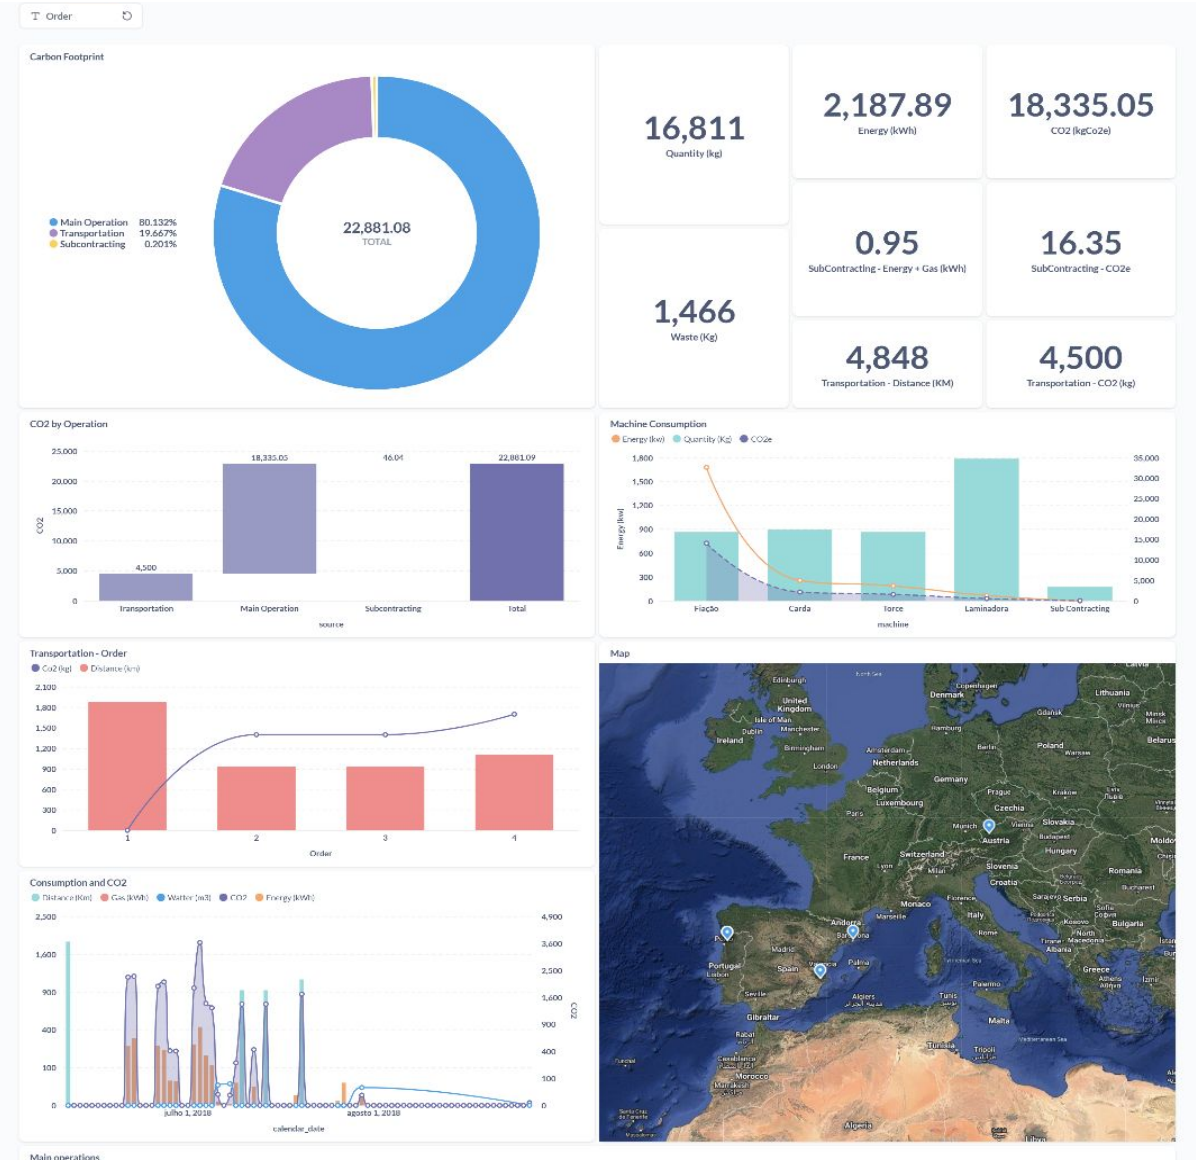

This project has the main goal:

- ✓ valorise **digital resources**;
- ✓ developing of software to **monitor** and **collect data**;
- ✓ **reinvent** new **production routes** and, consequently, greener and more **traceable products**;
- ✓ **contributing** to the **digital passport** for textile products;
- ✓ real-time **energy consumption** monitoring throughout the production lifecycle and
- ✓ crossing energy data with the bill of materials (**BOM**);
- ✓ **calculating** the **LCA** of textile yarns.

**CREATING A SMART
AND SUSTAINABLE
SOCIETY DEPENDS**

ON US.

**CHANGING THE
WORLD IS IN OUR
HANDS!**

SMART INDUSTRY

All-in-one Solution

- ✓ To **simplify** the **process** and **support** the **digital transition**, IOTECH has developed an **all-in-one, modular** and **scalable** solution designed to accelerate the process and adapt to the specific needs of each industry.
- ✓ This **solution** is structured around four core modules:
 1. **Sensing and Monitoring** – for real-time data acquisition and system supervision with sensors installation..
 2. **Data Science and Artificial Intelligence** – to generate insights, predictions, dashboards and reports.
 3. **Digital Product Passport and Life Cycle Assessment (LCA)** – ensuring traceability, sustainability, and regulatory compliance.
 4. **Operational Control Center** – focus on factory floor digitalisation and intelligent machine control and automation.
- ✓ The solution **simplifies and optimize processes**, reduces **paper** usage, and **frees** up time for operators and decision-makers to focus on their **core tasks**.

The background of the slide features a dark blue field with a large, faint gear pattern. Various circular icons are scattered around, including a robotic arm, a radio tower, a cloud with arrows, a factory, and a smartphone. A large, stylized blue gear is positioned in the center-left area.

SMART INDUSTRY

All-in-one Solution

- ✓ The system enables **real-time monitoring** of a wide range of parameters, including:
 - **Asset consumption:** energy, water, gas, compressed air, vacuum, and more.
 - **Environment, Process** and **machine parameters:** rotations, meters, humidity, temperature, pH, turbidity, among others.
- ✓ It also supports/includes:
 - **Full connection** with existing systems / solutions (e.g. CRM, ERM, MES, others)
 - **Business Intelligence** through dashboards, KPI-driven reports, and insights
 - Registration and control of Digital **Product Passport** data
 - **Creation of LCA (Life Cycle Assessment)** indicators
 - **Machine control**, allowing start/stop operations via tablet—only after a service order has been properly assigned.
 - **Real-time alerts** notify users of overconsumption, air/gas leaks, out-of-range values, and other thresholds defined by each company.
